The Capacitive soil moisture sensor v1.2

It measures soil moisture by detecting changes in electrical capacitance rather than direct electrical resistance.

• What it measures?

- It measure the moisture in the soil – As the Water in the soil changes the dielectric property around the sensor's copper plates, altering the charge and discharge timing managed by an onboard timer chip (such as a 555-type IC)

• Supply Voltage:

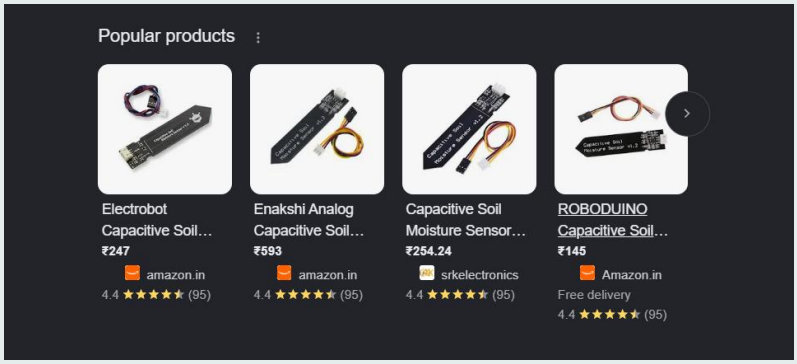

- Operating Voltage: 3.3V to 5.5V DC
- Output Voltage: 0 to 3.0V DC (Analog)
- Operating Current: ~5 mA

• Output type(analog):

1. Higher moisture level = lower analog(output) voltage or a lower raw value
2. Lower moisture level = higher output value

• Price range in india:

- 150 – 600 rupees

• Basic Arduino Connection

- VCC: Connect to `3.3V` or `5V` on your microcontroller.
- GND: Connect to `GND`
- AOUT: Connect to an analog pin (e.g., `A0`
